

How will the Source Protection Plan affect activities on my property?

Residents

Area: Miller Manor Wellhead Protection Area D (vulnerability score: 4)

Water Source: Groundwater (municipal well)

Why is source protection important?

Source water protection means protecting our sources of drinking water such as lakes, rivers and groundwater from being contaminated or overused. Source water protection is important because water treatment is not always enough and some chemicals are not removed from water, even with a water treatment system. In some cases when the pollution cannot be cleaned up, the resulting contamination can ruin a water source forever. It is much easier to keep water clean than it is to try and clean it up after it has been polluted. Further details about the benefits of source protection can be found on the clean water cataraqui website at www.cleanwatercataraqui.ca.

What is a wellhead protection area?

A wellhead is the physical part of the well that sits above the ground. A Wellhead Protection Area (WHPA) is the area around the wellhead that contributes source water to a drinking water system (i.e. municipal wells) where actions must or should be taken to protect the drinking water supply.

Wellhead Protection Area D (WHPA-D) is one of five areas that form a complete WHPA. WHPA-D is an area where water and any pollution that may be present can reach the well within 25 years.

What can you do?

Everyone in Miller Manor WHPA-D can help protect the drinking water supply. You can:

- Handle and dispose of waste properly
- Maintain heating oil tanks and fill lines
- Maintain and use septic systems properly
- Maintain wells and upgrade as necessary
- Hire a licensed well contractor to properly plug unused wells
- Avoid or limit use of chemicals such as fertilizer, pesticides and road salt

The Cataraqui Source Protection Plan might apply to you if you:

- Have a septic system or holding tank

Spilled oil can seep into soils and groundwater and flow into the rivers and lakes that supply your drinking water, causing contamination.

Septic systems that are in good working order help reduce the risk of drinking water contamination, both to your water supply and your neighbour's.

Specific requirements that apply to residents in Miller Manor WHPA-D:

If you have a septic system or holding tank in Miller Manor WHPA-D

On-going maintenance of a septic system or holding tank, or repair of an unsafe system, is necessary to ensure proper function and prevent pollution. Owners/operators of a septic system/holding tank are responsible for maintaining their septic system/holding tank. The municipality **may establish** an on-site sewage system maintenance inspection program in Miller Manor WHPA-D.

Since the Township of Front of Yonge relies on the Leeds, Grenville and Lanark District Health Unit for septic system approvals and inspections, the Health Unit will send you a letter explaining what is required. Depending on whether you have made any recent improvements to your septic system or holding tank, a physical inspection may not be necessary. It is expected that there will be no costs for homeowners if an inspection is required. An inspection may involve:

1. Review of the system approval to determine if the age and/or size of the building it services may be a concern.
2. Observation of the tile or filter bed for any obvious problems.
3. Observation of the tank before and possibly after it has been pumped out.

Although the Health Unit will need to review the information from the inspection, the actual on-site work can be completed by a person that meets the requirements of the Building Code (e.g. a licensed sewage system installer or engineer). The Health Unit will then follow-up with any necessary improvements and information about how to keep your system working properly.
